## FLOORING MADE OF PVC, INCLUDING COVINGS

The floor in clean rooms requires high durability and easy cleanability. To ensure the maximum cleanability of the room corners, it is necessary to use covings for a smooth transition between the flooring and the wall. The pre-pressed flooring elements are inserted into the corners to ensure fast and smooth connection. Therefore, PVC-based materials are selected for floors. The particular type of PVC is determined by the designer at the request of the investor.

### Material:

PVC-based flooring - conductive, electrostatic, depending on the load, homogeneous and heterogeneous

### Weight:

Inner corner piece 2FP - 200g

Inner corner piece 3FP - 200g
